

# PRACTICA 1 - DESPLIEGUE DE CLOUD FUNCTION DE INGESTA DE DATOS

ARQUITECTURA DE SERVICIOS DE RED - CLOUD

Teresa González García 1º MIT + ADE

- Crear CLOUD STORAGE BUCKET
- Crear Dataset BQ + tabla.
- Deployment.sh
  - Codigo ejecutable main.py funcion run endpoint Cloud Functions ->
    trigger que se levanta cada vez que le llegue un archivo. FILE = EVENT.
     Dentro del entrypoint run (event, context)
  - Trigger bucket. File evento = blob. FUNCION CARGAR BLOB EN BQ
  - Dentro de endpoint:
    - Download blob archivo local
    - Preparar blob con dataframe (filas, columnas) -> requirements.txt. STRING Y FLOAT
    - Subir a BQ con formato apropiado.
- Crear CLOUD SOURCE REPOSITORY y subir todo el proyecto.
- Estimar costes proyecto 1700 transaciones/s ->procesado, almacenamiento Storage y
   Big Query.

# 1. Crear bucket

```
C:\Users\teete\AppData\Local\Google\Cloud SDK> gsutil mb -c standard gs://asr-cloud-201701454
Creating gs://asr-cloud-201701454/...
C:\Users\teete\AppData\Local\Google\Cloud SDK>gsutil ls
gs://artifacts.nifty-envoy-328012.appspot.com/
gs://asr-cloud-201701454/
```

Blob path gs://asr-cloud-201701454

Por defecto location US multiregion (la + barata, tienen muchos DC)

Inicialmente vacio

# Crear dataset transactions y tabla records BQ

Instalamos comandos Alpha para acceder a bq (una opción)

C:\Users\teete\AppData\Local\Google\Cloud SDK>gcloud alpha bq datasets create transactions --description 'Transactions' Created dataset [transactions].

Por defecto location US multiregion (la + barata, tienen muchos DC).

Clave administrada por Google

Inicialmente vacio.

# 3. Ejecutar Deployment.sh

- Archivo bash ejecutable unix
- Crea bucket si no existe
- Crea BQ y tabla si no existe.
- Deploy CF definida
  - Funcion entrypoint (ingest\_transactions dentro del main.py)
  - Runtime (python 3.8)
  - Trigger-resource = BUCKET
  - Trigger-event = SE GUARDA NUEVO ARCHIVO/OBJETO

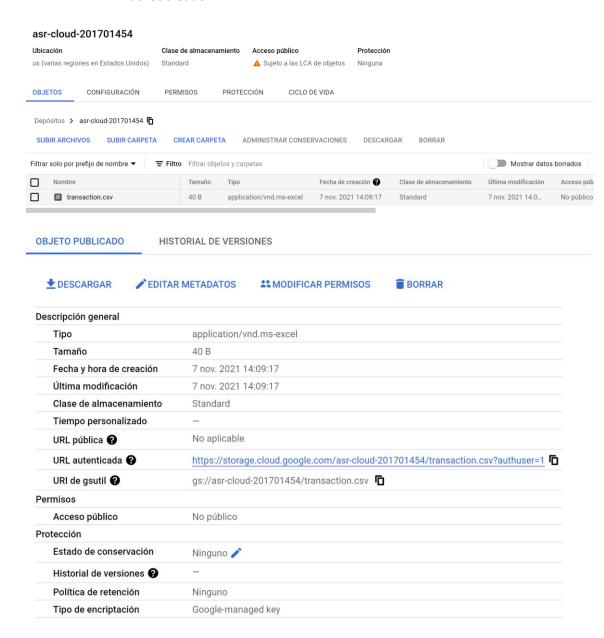

Importante bq.cmd en Windows, si no bash no reconoce el comando.

Se ejecuta

PS C:\Users\teete\PracticaCloud\Practica1> .\deployment.sh

# 4. RESULTADOS

#### - Bucket creado

- Cloud Function creada y ejecutada.

# **Ejemplo logs Cloud Function**

```
        ▶ 3
        2021-11-07T17:55:09.942768631Z ingester-transactions br2hh9hi8yn0

        Function execution took 6222 ms, finished with status: 'ok'
```

#### Info función

Tabla transactions.records con datos (dataframe)

# 5. OTRAS PRUEBAS

Subimos otro archivo con otro nombre y + transacciones

C:\Users\teete\AppData\Local\Google\Cloud SDK> gsutil cp C:\Users\teete\PracticaCloud\Practica1\transaction1.csv gs://asr-cloud-201701454
Copying file://C:\Users\teete\PracticaCloud\Practica1\transaction1.csv [Content-Type=application/vnd.ms-excel]...
/ [1 files][ 72.0 B/ 72.0 B]
Operation completed over 1 objects/72.0 B.

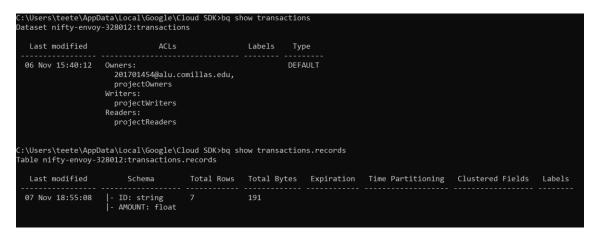

```
C:\Users\teete\AppData\Local\Google\Cloud SDK>gsutil ls gs://asr-cloud-201701454
gs://asr-cloud-201701454/transaction.csv
gs://asr-cloud-201701454/transaction1.csv
```

Se ha insertado en la tabla records los nuevos registros formateados (fila 2 y 3).

# records

Esque	ma Detalles <mark>Vista p</mark>	Detalles Vista previa						
Fila	ID	AMOUNT						
1	201701454teresa12	100000.55						
2	201701454teresa12	100000.55						
3	1234567teresaprueba	1000.6789						

#### Se añaden más transacciones

# Ejemplo QUERY

```
C:\Users\teete\AppData\Local\Google\Cloud SDK> bq query select * from transactions.records

              2 dirs 836.302.458.880 bytes libres
```

# Primer commit y push a la rama origin/master

7. Estimar costes mensuales 1700 transacciones por segundo (almacenamiento y procesamiento)

## CLOUD STORAGE

# <u>Almacenamiento</u>

- Multi-region (US)
- Standard Storage

```
C:\Users\teete\PracticaCloud>gsutil du -sh gs://asr-cloud-201701454/transaction.csv
40 B gs://asr-cloud-201701454/transaction.csv
```

Aproximadamente, cada archivo de transacción: 1 fila, 2 columnas son 40 bytes.

1700 transaciones/s -> En 1 segundo -> 68000 B= 66,40625 Kibibytes.

#### BIG QUERY

#### Almacenamiento

- Multi-region (US)
- Aproximadamente, cada archivo 27 bytes.

1700 transaciones/s -> En 1 segundo -> 45900 B = 44,8242188 Kibibytes.

En un mes -> 118972800000 B = 116184375 Kibibytes = 110,802054405212 Gibibytes

# Extra: Procesamiento consultas (simples)

1 consulta -> 0.4 segundos y 27 B procesados/transacción

1700 transaciones/s -> En 1 segundo -> 45900 B = 44,8242188 Kibibytes.

En un mes -> 118972800000 B = 116184375 Kibibytes = **110,802054405212** Gibibytes (active, long-term storage)

# - CLOUD FUNCTION (Procesamiento)

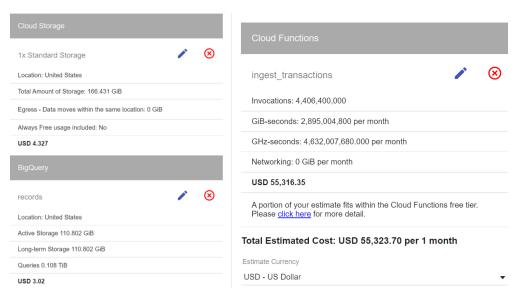

Tiempo ejecución -> 1.314 segundos. = 1314 ms

Tipo -> 512 MB (CPU 800 MHZ)

Número de invocaciones (<2 mill gratis):

1700 invocaciones /s -> 2592000 s (mes 30 días) \* 1700 = 4.406.400.000 invocaciones /mes

# - COSTE TOTAL MENSUAL = 55323.70 \$
